                                                         The present sequence is human caspase recruitment domain-14 (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bcl-10 and stimulates phosphorylation of Bcl-10 or activation of nuclear factor-kappa B (NF-kB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of cancer. It is also useful for the treatment of autoimmune disorders (e.g., systemic lupus erythematosus), neurological disorders e.g., Alzheimer's and ParkInson's disease, inflammatory disorders, haematological disorders (e.g., anaemia myelodysplastic syndromes), myocardial infarctions, strokes, immune disorders (e.g., Crohn's disease, allergic rhinitis), cell signalling disorders and certain viral and bacterial infections.

                                                                                                                                                           The present sequence is predicted human caspase recruitment domain-14 (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bol-10 and stimmlates phosphorylation of Bol-10 or activation of nuclear factor-kappa B (NF-kB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of autoimmune disorders (e.g., systemic lupus erythematosus), neurological disorders e.g., Alzheimer's and Parkinson's disease, inflammatory disorders, haematological disorders and parkinson's disease, inflammatory disorders, haematological disorders strokes, immune disorders (e.g., annowne disorders (e.g., crohn's disease, allergic rhinitis), cell signalling disorders and certain viral and bacterial infections.
An isolated caspase recruitment domain polypeptide useful for regulating growth and cell death and useful for the treatment of cancer

```
The present sequence represents novel human caspase recruitment domain, CARD-11. The polynucleotide encoding this sequence was isolated from a human T-cell cDNA library. Also described are sequences for CARD-9 and CARD-10 (AAU01205, AAU01206) and rat CARD-9 (AAU01204). CARD-9, CARD-10 and CARD-11 interact with Bol-10 which is thought to activate nuclear factor (NF) kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-9, CARD-10, or CARD-11. They can be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. systemic lupus erythematosus), neurological disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. crohos disease), and viral infection (e.g. HIV). The CARD polypeptide, polynucleotide and an antibody which selectively binds to CARD can be used in screening and detection assays (e.g. chromosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteins, CARD-9, CARD-10, as immunogens, and in screening

             The
mapping, tissue typing), predictive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for regulating inflammation, cancer, NF kappaB signalling, stress related response and apoptosis in human disease. A host cell containing a polynucleotide encoding CARD can be used to create transpenic animals.

from a human skin cDNA library. Also described are novel human sequences from a human skin cDNA library. Also described are novel human sequences for CARD-10. The polynucleotide encoding this sequence as sequences of the care and the control of the care and the control of the care and the care and the care and the care and the care as a sequence of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-9, CARD-10, or CARD-11. They can be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. systemic lupus errythematosus), neurological disorders (e.g. Alzhehmer's disease), inflammatory disorders (e.g. crohn's disease), and viral infection (e.g. HIV). The CARD polypeptide, polynucleotide and an antibody which selectively binds to CARD can be used in screening and an antibody which selectively binds to CARD can be used in screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and detection assays (e.g. chromosomal mapping, tissue typing), predictive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for regulating inflammation, cancer, NF-kappab signalling, stress-related response and apoptosis in human disease. A host cell containing a polynucleotide encoding CARD can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel caspase recruitment domain (CARD) proteins, CARD-9, CARD-10, CARD-11, useful as targets for therapy, as immunogens, and in screening and detection assays -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present sequence represents novel human caspase recruitment

The invention relates to an isolated plakoglobin interacting polypeptide (I). (I) is useful as a medicament and in the manufacture of a medicament for treating plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and to screen compounds that interfere with the interaction of the polypeptide with plakoglobin related diseases include basal cell carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Hailey's disease or Darier's disease, and ectodermal dysplasia/Skin fragility syndrome. AAU73245-AAU73254 represent novel human plakoglobin interacting protein amino acid sequences and related sequences of the invention.
                                                                                                                                                                                                                                         Human; plakoglobin; cytostatic; osteopathic; dermatological; cardiant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, useful for treating skin carcinoma or acantholytic diseases such as Grover's and Darier's disease, comprises a protein interacting with human plakoglobin and involved in transduction of plakoglobin related signal to nucleus -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DEETLWEMMESHRHRIVRCICPSRLTPYLRQAKVLCQLDEEEVLHSPRLTNSAMRAGHLL 65

The present sequence trepresents movel that caspase Fectivithment domain, CARD-9. The polynucleotide encoding this sequence was isolated from a rat neuronal cDNA library. Also described are novel solated from a rat neuronal cDNA library. Also described are novel caspanes for CARD-9, CARD-10 and CARD-11 interact with Bel-10 which is thought to activate nuclear factor (NF)-kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression of activity of CARD-9, CARD-10, or CARD-11. They can be used for activity of CARD-9, CARD-10, or CARD-11. They can be used for cartivity of CARD-9, CARD-10, or CARD-11. They can be used for cortaction and viral infection (e.g. HIV). The CARD polypeptide, alsorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. crohn's disease), and viral infection (e.g. thry). The CARD con be used in screening and detection assays (e.g. chromosomal mapping, tissue typing), predictive medicine (prognostic assays, monitoring clinical crimials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD can be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for regulating inflammation, cancer, NF-kappaB signalling, stress-related response and apoptosis in human disease. A host cell containing a polynucleotide encoding CARD can be used to create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel caspase recruitment domain (CARD) proteins, CARD-9, CARD-10, CARD-11, useful as targets for therapy, as immunogens, and in screening and detection assays -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

antipositatic; antiparties such as 'yeother's properties, antiparties, antiparties, antiparties, antiparties, antiparties, antiparties, antiparties, antiparties, antiparties, immunosuppressant; ordiant; thrombolytic; coagulant; vasotropic; antidulabetic: hypotensive; dermatological; immunosuppressive; antidiabetic: hypotensive; dermatological; immunosuppressive; antidiabetic: hypotensive; dermatological; antifungal; antirheumatic; antidinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an OREX associated disorder. The nucleic acids can be used to express OREX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus
                                                                                                                                                                                                                                                                   vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; osteopathic; antiarthritic; immunosuppressant; cardiant; immunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antiiviral; antibacterial; antifungal; antirheumatic; antithyroid;

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27552 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders realated to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious

            arthritis, autoimmune thyroiditis, myasthenia gravis, graft.versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an Oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                              N.B. The sequence data for this patent did not form part of the printer specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
 diseases, autoimmune disorders such as multiple sclerosis, rheumatoid

           complementary strand of a polymucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polymucleotide which comprises a 3'-end sequence. Where the complementary to a ligonucleotide which comprises a 1'-end sequence, where the combination of the 5'-end sequence 1s selected from those defined in the specification. The primers are useful for synthesising polymucleotides, particularly full-length cDNAs. The primers are useful for synthesising polymucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs as 11'-length cDNAs. The primers allow obtaining of the full-length AAH13618 and AAH13631 cAAH13618 represent human cDNA sequences; AAB92446 to AAH13632 represent toligonucleotides, all of which are used in the exemplification

The present sequence represents novel human caspase recruitment domain, CARD-9. The polynuclectide encoding this sequence was isolated from a human megakaryocyte cDNA library. Also described are novel human sequences for CARD-10 and CARD-11 interact with Bcl-10 and rat CARD-9 (AAU01204). CARD-9, CARD-10 and CARD-11 interact with Bcl-10 which is thought to activate nuclear factor (NF) kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-9, CARD-10, or CARD-11. They can be used for the treatment of hyperproliferative disorders (e.g.

a
cancer), autoimmune disorders (e.g. systemic lupus erythematosus), neurological disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. crohn's disease), and viral infection (e.g. HIV). The CARD polypeptide, polynucleotide and an antibody which selectively binds to CARD can be used in screening and detection assays (e.g. chromosomal mapping, tissue typing), predictive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for regulating inflammation, cancer, MP-kappab signalling, stress-related response and apopptosis in human disease. A host cell containing a polynucleotide encoding CARD can be used to create transgenic animals.

The invention relates to protein acts as a positive regulator of apoptosis, potentiating apoptosis induced by caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions which will modulate the interactions of the various compositions and DREP-1). RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening assays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis, overexpression of ARC in an in vitro cell system can be used to identify inhibitors of the enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RICK; mouse; RIP-like interacting CLARP kinase; apoptosis regulator; ARC; caspase-10; CD95 signalling; apoptosis signalling pathway; CIDE-A; CIDE-B; DREP-1; diagnosis; cell growth; apoptosis dysregulation; gene therapy; cardiac disorder; cancer; neurodegenerative disorder; AIDS; aplastic anaemia; ischaemic injury; toxin-induced liver disease;
                The plakoglobin related diseases include basal cell carcinoma, squamous cell carcinoma, extramamnary paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Halley-Halley's disease or Darier's disease, and ectodermal dysplasia/skin fragility syndrome. AAU73254 represent novel human plakoglobin interacting protein amino acid sequences and related sequences of the invention.
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Compositions for identifying apoptosis signalling pathway inhibitors useful for treating diseases -
interfere with the interaction of the polypeptide with plakoglobin

activity of caspase-8. Identification of ARC-like inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used and cardiac disorders, and toxin-induced liver disorders, aplastic anaemia, ischaemic injury, and toxin-induced liver disorders, aplastic anaemia, ischaemic injury, and toxin-induced liver affinity chromatography media, and for diagnostically measuring RICK levels. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such as CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK binding to intracellular apoptosis factors are potential drug candidates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is the mouse CIPER protein. The invention relates to the human RICK (RIP-like interacting CLARP kinase) protein. The RICK protein acts as a positive regulator of apoptosis, potentiating apoptosis induced by caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RICK; mouse; RIP-like interacting CLARP kinase; apoptosis regulator; ARC; caspase-8; caspase-10; CD95 signalling; apoptosis signalling pathway; CIDE-A; CIDE-B; DREP-1; diagnosis; cell growth; apoptosis dysregulation; gene therapy; cardiac disorder; cancer; neurodegenerative disorder; AIDS; aplastic anaemia; ischaemic injury; toxin-induced liver disease;

and DREP-1). RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening assays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking Or95-mediated apoptosis. Overexpression of ARC in an in vitro cell system can be used to identify inhibitors of the enzymatic activity of caspase-8. Identification of ARC-like inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to treat e.g. cancer, AIDS, neurodegenerative disorders, aplastic anaemia, ischaemic injury, and toxin-induced liver of disease. AntiRICK antibodies can be used as reagents for the preparation or affinity chromatography media, and for diagnostically measuring RICK levels. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such as CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK binding to intracellular apoptosis factors are potential drug candidates.
                                                                                                                                                                                                                                                                                                                                                                                                                         4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

The invention relates to an immunogenic complex comprising one glycoside and one lipid, integrated into an iscom complex or matrix and one antigen which is integrated into the iscom complex or coupled on to or mixed with the iscom complex or iscom matrix complex, also comprising an enzyme. The immunogenic complex is used for providing iscom complexes on to which a receptor expressed on a cell capable of antigen presentation. The complex may also be used as an immunogenic matrix complex compression on a lipid onto which antigens, enzymes and/or peptides or glycoside, a lipid onto which antigens, enzymes and/or peptides or grotelins, which specifically bind to a receptor expressed on a cell capable of antigen presentation have been coupled. The invention is used as vaccine. The present sequence is cholera toxin Al subunit (CTAI)-OVA An immunogenic complex for use as immunostimulating complexes (iscoms) or matrixes comprises a glycoside and a lipid integrated into the 1092 GLVDASDFETSVMAGLENKSGKKCINFCHSHRIOSSLMVISHLITLFLTRGNXXVVLMLD 1151 ------RHRIVRCICPSRLTPYLRQAKVLCQLD- 44 -----EEEVL------HSPRLTNSAMRAGHLLDLLKTRGKNGAIAFLE 81 41; Kaastrup DB 23; Length 1266; Indels Loewenadler B, 37; Pred No. 12; ; Mismatches Score 70.5; Search completed: January 22, 2003, 08:52:10 Job time : 22.8535 secs /note= "Encoded by TGA" /note= "Encoded by TGA" Mc Mowat A, Example 2; Fig 7; 64pp; English. 17; 12.6%; 01-OCT-2001; 2001WO-SE02117 29-SEP-2000; 2000SE-0003538 protein of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2, Application US/08942761
Patent No. 6068843
GENERAL INFORMATION:
APPLICANT: Duhamel, Gerald E.
APPLICANT: Blder, Robert
ATTLE OF INVENTION: Nucleotide Sequences and Methods for TITLE OF INVENTION: Detection of Serpulina Hyodysenteriae
                                      GERREAL INFORMATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A Method for Characterizing the Nucleotide Sequence of LICAM and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     26;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18, Application US/08427497E
Patent No. 5969124
GENERAL INFORMATION: Vance
APPLICANT: Lemmon, Vance
TITLE OF INVENTION: Nucleotide Sequence of LIC;
Patent No. 5969124
TITLE OF INVENTION: the Nucleotide Sequence
TITLE OF INVENTION: Characterized Thereby
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                            ORGANISM: mouse
INDIVIDUAL ISOLATE: 8 day old mouse brain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 13
US-09-065-474-15
US-09-065-474
Sequence 15, Application US/09065474
Patent No. 6063599
GENERAL INFORMATION:
APPLICANT: Tang, Liang
APPLICANT: Tang, Liang
TITLE OF INVENTION: DIROFILARIA AND BRUGIA ANKYRIN
TITLE OF INVENTION: PROTEINS, NUCLEIC ACID MOLECULES, AND
TITLE OF INVENTION: USES THEREOF
NUMBER OF SEQUENCES: 171
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            COMPUTER READBLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM Windows 95
SOFTWARE: WordPerfect for Windows, Version 7.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- TISSUE SPECIFICITY: Expressed in placenta. Also detected in HeLa
-!- SIMILARITY: Dut not in the other cancer cell lines tested.
-!- SIMILARITY: CONTAINS I CARD DOMAIN.
-!- SIMILARITY: CONTAINS I PDZ/DHR DOMAIN.
-!- SIMILARITY: CONTAINS I GUANYLATE KINASE-LIKE DOMAIN.
-!- CAUTION: Supposed to contain a SH3 domain which is not detected by PROSITE, Pfam or SMART.
                                                                         15-JUN-2002 (Rel. 41, Created)

Caspase recruitment domain protein 14 (CARD-containing MAGUK protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Strausberg R.;
Submitted (DEC-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Activates NF-kappaB via Bcl10 and IKK. Stimulates the
phosphorylation of Bcl10.
-!- SUBUNIT: CARD14 and Bcl10 bind to each other by CARD-CARD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaide O., Martinon F., Micheau O., Bonnet D., Thome M., Tschopp J., "Carmal, a CARD-containing binding partner of Bc110, induces Bc110 phosphorylation and NF-Repaga activation."; FEBS Lett. 496:121-127(2001).
